

Set-up your company asset register

Manage all of your company's equipment, vehicles, chemicals, and records in one place

1

Create categories and custom fields

Configure custom fields and categories so that your asset register works exactly how you need. Then filter and record information relevant to a category (e.g. odometer reading for vehicles).

2

Add assets & generate QR codes

Add your asset's details, photos, and category. Each asset has its own QR code that you can print and attach to the asset. This makes it easy for people to scan the QR and bring up the asset's information.

3

Link asset documents and forms

Link documents and forms to assets, like SOPs, inductions, and pre-start check-lists. This makes it easy for teams to meet safety requirements at the point of work.

4

Link assets to tasks and incidents

Reported incidents and follow-up actions linked to assets create a clear record that equipment has been maintained in a safe working condition.
